Package 'CARNIVAL'

October 18, 2022

Title A CAusal Reasoning tool for Network Identification (from gene
expression data) using Integer VALue programming

Version 2.6.2

Description An upgraded causal reasoning tool from Melas et al in R with updated assign-
ments of TFs' weights from PROGENy scores.
Optimization parameters can be freely adjusted and multiple solutions can be obtained and ag-
gregated.

R **topics documented:**

---

checkOptionsValidity   *Checks if provided option names are valid.*

Description

Checks if provided option names are valid.

Usage

```
checkOptionsValidity(solver = getSupportedSolvers()$lpSolve, ...)
```

Arguments

solver   one of the solvers available from getSupportedSolvers().

...   any possible options from the solver's list

Value

TRUE/FALSE depending on the status of the checks

Examples

```
checkOptionsValidity(solver="lpSolve")
```

---

defaultCbcSolveCarnivalOptions
                    Sets default CARNIVAL options for cbc.

Description

Sets default CARNIVAL options for cbc.

Usage

```
defaultCbcSolveCarnivalOptions(...)
```

Arguments

. . .   any possible options from the solver's list

Value

default CbB solver options as a list.

Examples

```
#defaultCbcSolveCarnivalOptions()
```

---

defaultCplexCarnivalOptions
                    Sets default CARNIVAL options for cplex.

Description

Sets default CARNIVAL options for cplex.

Usage

```
defaultCplexCarnivalOptions(...)
```

Arguments

. . .   any possible options from the solver's list

Value

default CPLEX solver options as a list.

Examples

```
defaultCplexCarnivalOptions()
```

```
defaultCplexSpecificOptions
```
Sets default options from cplex documentation.

Description

Sets default options from cplex documentation.

Usage

```
defaultCplexSpecificOptions(...)
```

Arguments

...	any possible options from the solver's list

Value

default CPLEX solver options as a list.

Examples

```
defaultCplexSpecificOptions()
```

```
defaultLpSolveCarnivalOptions
```
Sets default CARNIVAL options for lpSolve.

Description

Sets default CARNIVAL options for lpSolve.

Usage

```
defaultLpSolveCarnivalOptions(...)
```

Arguments

...	any possible options from the solver's list

Value

default lpSolve solver options as a list.

Examples

```
defaultLpSolveCarnivalOptions()
```

---

generateLpFileCarnival

generateLpFileCarnival

Description

generateLpFileCarnival

Usage

```
generateLpFileCarnival(
  perturbations = NULL,
  measurements,
  priorKnowledgeNetwork,
  weights = NULL,
  carnivalOptions = defaultLpSolveCarnivalOptions()
)
```

Arguments

perturbations	(optional, if inverse CARNIVAL flavour is used further) vector of targets of perturbations.
measurements	vector of the measurements (i.e. DoRothEA/VIPER normalised enrichment scores)
priorKnowledgeNetwork	
	data frame of the prior knowledge network
weights	(optional) vector of the additional weights: e.g. PROGENy pathway scores or measured protein activities.
carnivalOptions	
	the list of options for the run. See defaultLpSolveCarnivalOptions(), defaultCplexCarnivalOptions, defaultCbcCarnivalOptions.

Details

Prepares the input data for the run: tranforms data into lp file and .Rdata file. These files can be reused to run CARNIVAL without preprocessing step using runCarnivalFromLp(..)

Value

paths to .lp file and .RData file that can be used for runFromLpCarnival()

Examples

```
load(file = system.file("toy_perturbations_ex1.RData",
                        package="CARNIVAL"))
load(file = system.file("toy_measurements_ex1.RData",
                        package="CARNIVAL"))
load(file = system.file("toy_network_ex1.RData",
                        package="CARNIVAL"))

## lpSolve
#res1 = generateLpFileCarnival(perturbations = toy_perturbations_ex1,
#                              measurements = toy_measurements_ex1,
#                              priorKnowledgeNetwork = toy_network_ex1,
#                              carnivalOptions = defaultLpSolveCarnivalOptions())

#res1["lpFile"] ##path to generated lp file
#res1["parsedDataFile"] ##path to data file used during generation

## Examples for cbc and cplex are commented out because these solvers are not part of R environment
## and need to be installed separately
##
## cbc
## res2 = generateLpFileCarnival(perturbations = toy_perturbations_ex1,
##                               measurements = toy_measurements_ex1,
##                               priorKnowledgeNetwork = toy_network_ex1,
##                               carnivalOptions = defaultCbcCarnivalOptions())
##
## res2["lpFile"] ##path to generated lp file
## res2["parsedDataFile"] ##path to data file used during generation
##
## cplex
## res3 = generateLpFileCarnival(perturbations = toy_perturbations_ex1,
##                               measurements = toy_measurements_ex1,
##                               priorKnowledgeNetwork = toy_network_ex1,
##                               carnivalOptions = defaultCplexCarnivalOptions())
##
## res3["lpFile"] ##path to generated lp file
## res3["parsedDataFile"] ##path to data file used during generation
```

---

getOptionsList   *Returns the list of options needed/supported for each solver.*

Description

Returns the list of options needed/supported for each solver.

Usage

```
getOptionsList(solver = "", onlyRequired = FALSE)
```

Arguments

solver	one of the solvers available from getSupportedSolvers()
onlyRequired	logic, set to TRUE if you want to obtain only required options for the run

Value

list of options, solver-dependent

---

getSupportedSolvers	*Returns the list of supported solvers.*

Description

Returns the list of supported solvers.

Usage

```
getSupportedSolvers()
```

Value

list of currently supported solvers.

---

isInputValidCarnival	*Checks validity of all inputs of CARNIVAL*

Description

Checks validity of all inputs of CARNIVAL

Usage

```
isInputValidCarnival(
  perturbations = NULL,
  measurements,
  priorKnowledgeNetwork,
  weights = NULL,
  carnivalOptions = defaultLpSolveCarnivalOptions()
)
```

Arguments

perturbations	(optional, if inverse CARNIVAL flavour is used further) vector of targets of perturbations.
measurements	vector of the measurements (i.e. DoRothEA/VIPER normalised enrichment scores)
priorKnowledgeNetwork	
	data frame of the prior knowledge network
weights	(optional) vector of the additional weights: e.g. PROGENy pathway scores or measured protein activities.
carnivalOptions	
	the list of options for the run. See defaultLpSolveCarnivalOptions(), defaultC-plexCarnivalOptions, defaultCbcCarnivalOptions.

Value

TRUE if everything passed the checks.

Examples

```
load(file = system.file("toy_perturbations_ex1.RData",
                        package="CARNIVAL"))
load(file = system.file("toy_measurements_ex1.RData",
                        package="CARNIVAL"))
load(file = system.file("toy_network_ex1.RData",
                        package="CARNIVAL"))

## lpSolve
#isInputValidCarnival(perturbations = toy_perturbations_ex1,
#                     measurements = toy_measurements_ex1,
#                     priorKnowledgeNetwork = toy_network_ex1,
#                     carnivalOptions = defaultLpSolveCarnivalOptions())
```

---

parseCplexLog	*Parses the cplex log file and reads some basic information.*

Description

Parses the cplex log file and reads some basic information.

Usage

```
parseCplexLog(log)
```

Arguments

log	path of log file resulted from a carnival run OR the content of this file read by read_lines.

Value

list variable with following fields: - 'convergence' a table that contains information on the convergence of CPLEX - 'n_solutions' number of solutions found - 'objective' objective function value - 'termination_reason': reason of termination

Author(s)

Attila Gabor, 2021

---

runCARNIVAL   runCARNIVAL

Description

runCARNIVAL

Usage

```
runCARNIVAL(
  inputObj = NULL,
  measObj = measObj,
  netObj = netObj,
  weightObj = NULL,
  solverPath = NULL,
  solver = c("lpSolve", "cplex", "cbc", "gurobi"),
  timelimit = 3600,
  mipGAP = 0.05,
  poolrelGAP = 1e-04,
  limitPop = 500,
  poolCap = 100,
  poolIntensity = 4,
  poolReplace = 2,
  alphaWeight = 1,
  betaWeight = 0.2,
  threads = 0,
  cleanTmpFiles = TRUE,
  keepLPFiles = TRUE,
  clonelog = -1,
  dir_name = getwd()
)
```

Arguments

inputObj	Data frame of the list for target of perturbation - optional or default set to NULL to run invCARNIVAL when inputs are not known.
measObj	Data frame of the measurement file (i.e. DoRothEA normalised enrichment scores) - always required.

netObj	Data frame of the prior knowledge network - always required.
weightObj	Data frame of the additional weight (i.e. PROGENy pathway score or measured protein activities) - optional or default set as NULL to run CARNIVAL without weights.
solverPath	Path to executable cbc/cplex file - default set to NULL, in which case the solver from lpSolve package is used.
solver	Solver to use: lpSolve/cplex/cbc (Default set to lpSolve).
timelimit	CPLEX/Cbc parameter: Time limit of CPLEX optimisation in seconds (default set to 3600).
mipGAP	CPLEX parameter: the absolute tolerance on the gap between the best integer objective and the objective of the best node remaining. When this difference falls below the value of this parameter, the linear integer optimization is stopped (default set to 0.05)
poolrelGAP	CPLEX/Cbc parameter: Allowed relative gap of accepted solution comparing within the pool of accepted solution (default: 0.0001)
limitPop	CPLEX parameter: Allowed number of solutions to be generated (default: 500)
poolCap	CPLEX parameter: Allowed number of solution to be kept in the pool of solution (default: 100)
poolIntensity	CPLEX parameter: Intensity of solution searching (0,1,2,3,4 - default: 4)
poolReplace	CPLEX parameter: Replacement strategy of solutions in the pool (0,1,2 - default: 2 = most diversified solutions)
alphaWeight	Objective function: weight for mismatch penalty (default: 1 - will only be applied once measurement file only contains discrete values)
betaWeight	Objective function: weight for node penalty (default: 0.2)
threads	CPLEX/CBC parameter: Number of threads to use default: 0 for maximum number possible threads on system
cleanTmpFiles	logic (default-TRUE), specifying if the tmp files made by solvers should be cleaned after run.
keepLPFiles	logic (default=TRUE), specifying if the LP file should be kept.
clonelog	determines if CPLEX clones the log files in case of multi-threaded optimization, default: -1, (no cloning)
dir_name	Specify directory name to store results. by default set to NULL

Details

Run CARNIVAL pipeline using to the user-provided list of inputs or run CARNIVAL built-in examples. The function is from v1.2 of CARNIVAL and is left for backward compatibility.

Value

The function will return a list of results containing:

1. weightedSIF: A table with 4 columns containing the combined network solutions from CARNIVAL. It contains the Source of the interaction (Node1), Sign of the interaction (Sign), the Target

of the interaction (Node2) and the weight of the interaction (Weight) which shows how often an interaction appears across all solutions.

2. nodesAttributes: A table with 6 columns containing information about infered protein activity states and attributes. It contains the Protein IDs (Node); how often this node has taken an activity of 0, 1 and -1 across the solutions (ZeroAct, UpAct, DownAct); the average activities across solutions (AvgAct); and the node attribute (measured, target, inferred).

3. sifAll: A list of separate network solutions.

4. attributesAll: A list of separate inferred node activities in each solution.

5. diagnostics: reports the convergence of optimization and reason of the termination. Only for CPLEX solver.

runFromLpCarnival   runCarnivalFromLp

Description

    runCarnivalFromLp

Usage

```
runFromLpCarnival(
  lpFile = "",
  parsedDataFile = "",
  carnivalOptions = defaultLpSolveCarnivalOptions()
)
```

Arguments

    lpFile   full path to .lp file

    parsedDataFile full path to preprocessed .RData file

    carnivalOptions

                        the list of options for the run. See defaultLpSolveCarnivalOptions(), defaultLp-
                        SolveCarnivalOptions, defaultCbcCarnivalOptions.

Details

    Runs CARNIVAL pipeline with preparsed data - lp file and Rdata file containing variables for ILP
    formulation.

Value

    The function will return a list of results containing: 1. weightedSIF: A table with 4 columns con-
    taining the combined network solutions from CARNIVAL. It contains the Source of the interaction
    (Node1), Sign of the interaction (Sign), the Target of the interaction (Node2) and the weight of the
    interaction (Weight) which shows how often an interaction appears across all solutions.

    2. nodesAttributes: A table with 6 columns containing information about infered protein activity
    states and attributes. It contains the Protein IDs (Node); how often this node has taken an activity of

0, 1 and -1 across the solutions (ZeroAct, UpAct, DownAct); the average activities across solutions (AvgAct); and the node attribute (measured, target, inferred).

3. sifAll: A list of separate network solutions.

4. attributesAll: A list of separate inferred node activities in each solution.

5. diagnostics: reports the convergence of optimization and reason of the termination. Only for CPLEX solver.

runInverseCarnival   runInverseCarnival

Description

runInverseCarnival

Usage

```
runInverseCarnival(
  measurements,
  priorKnowledgeNetwork,
  weights = NULL,
  carnivalOptions = defaultLpSolveCarnivalOptions()
)
```

Arguments

measurements	vector of the measurements (i.e. DoRothEA/VIPER normalised enrichment scores)
priorKnowledgeNetwork	
	data frame of the prior knowledge network
weights	(optional) vector of the additional weights: e.g. PROGENy pathway score or measured protein activities.
carnivalOptions	
	the list of options for the run. See defaultLpSolveCarnivalOptions(), defaultLp-SolveCarnivalOptions, defaultCbcCarnivalOptions.

Details

TODO Replace with correct description

Value

The function will return a list of results containing:

1. weightedSIF: A table with 4 columns containing the combined network solutions from CARNI-VAL. It contains the Source of the interaction (Node1), Sign of the interaction (Sign), the Target of the interaction (Node2) and the weight of the interaction (Weight) which shows how often an interaction appears across all solutions.

2. nodesAttributes: A table with 6 columns containing information about infered protein activity states and attributes. It contains the Protein IDs (Node); how often this node has taken an activity of 0, 1 and -1 across the solutions (ZeroAct, UpAct, DownAct); the average activities across solutions (AvgAct); and the node attribute (measured, target, inferred).

3. sifAll: A list of separate network solutions.

4. attributesAll: A list of separate inferred node activities in each solution.

5. diagnostics: reports the convergence of optimization and reason of the termination. Only for CPLEX solver.

runVanillaCarnival   runVanillaCarnival

Description

runVanillaCarnival

Usage

```
runVanillaCarnival(
  perturbations,
  measurements,
  priorKnowledgeNetwork,
  weights = NULL,
  carnivalOptions = defaultLpSolveCarnivalOptions()
)
```

Arguments

perturbations   vector of targets of perturbations.

measurements   vector of the measurements (i.e. DoRothEA/VIPER normalised enrichment
                   scores)

priorKnowledgeNetwork

                   data frame of the prior knowledge network

weights   (optional) vector of the additional weights: e.g. PROGENy pathway score or
                   measured protein activities.

carnivalOptions

                   the list of options for the run. See defaultLpSolveCarnivalOptions(), defaultLp-
                   SolveCarnivalOptions, defaultCbcCarnivalOptions.

Details

Runs full CARNIVAL pipeline, vanilla(classic) flavour.

Value

The function will return a list of results containing: 1. weightedSIF: A table with 4 columns containing the combined network solutions from CARNIVAL. It contains the Source of the interaction (Node1), Sign of the interaction (Sign), the Target of the interaction (Node2) and the weight of the interaction (Weight) which shows how often an interaction appears across all solutions.

2. nodesAttributes: A table with 6 columns containing information about infered protein activity states and attributes. It contains the Protein IDs (Node); how often this node has taken an activity of 0, 1 and -1 across the solutions (ZeroAct, UpAct, DownAct); the average activities across solutions (AvgAct); and the node attribute (measured, target, inferred).

3. sifAll: A list of separate network solutions.

4. attributesAll: A list of separate inferred node activities in each solution.

5. diagnostics: reports the convergence of optimization and reason of the termination. Only for CPLEX solver.

---

setCarnivalOptions   *Sets CARNIVAL options for the solver.*

Description

Sets CARNIVAL options for the solver.

Usage

```
setCarnivalOptions(solver = getSupportedSolvers()$lpSolve, ...)
```

Arguments

solver	one of the solvers available from getSupportedSolvers().
...	any possible options from the solver's list

Value

carnival options as list.

Examples

```
setCarnivalOptions(solver="lpSolve")
```

---

suggestedCbcSpecificOptions

Suggests cbc specific options.

Description

Suggests cbc specific options.

Usage

```
suggestedCbcSpecificOptions(...)
```

Arguments

...	any possible options from the solver's list

Value

additional CbC solver options as a list.

Examples

```
suggestedCbcSpecificOptions()
```

suggestedCplexSpecificOptions

Suggests cplex specific options.s

Description

Suggests cplex specific options.s

Usage

```
suggestedCplexSpecificOptions(...)
```

Arguments

...	any possible options from the solver's list

Value

additional CPLEX solver options as a list.

Examples

```
suggestedCplexSpecificOptions()
```

writeCplexCommandFileFromJson

writeCplexCommandFileFromJson

Description

writeCplexCommandFileFromJson

Usage

```
writeCplexCommandFileFromJson(
  carnivalOptions,
  jsonFileName = "parameters/cplex_parameters_cmd_file.json"
)
```

Arguments

carnivalOptions	list of options for the CPLEX solver
jsonFileName	name to JSONfile containing the solver parameters

Value

list of params

Index
