Package 'RJMCMCNucleosomes'

April 10, 2023

Version 1.22.0

Date 2021-11-21

Title Bayesian hierarchical model for genome-wide nucleosome
positioning with high-throughput short-read data (MNase-Seq)

Description This package does nucleosome positioning using informative
Multinomial-Dirichlet prior in a t-mixture with reversible jump
estimation of nucleosome positions for genome-wide profiling.

Depends R (>= 3.4), IRanges, GenomicRanges

Imports Rcpp (>= 0.12.5), consensusSeekeR, BiocGenerics, GenomeInfoDb,
S4Vectors (>= 0.23.10), BiocParallel, stats, graphics, methods,
grDevices

Suggests BiocStyle, knitr, rmarkdown, nucleoSim, RUnit

> *RJMCMCNucleosomes: Bayesian hierarchical model for genome-wide nucleosome positioning with high-throughput short-read data (MNase-Seq)*

Description

This package does nucleosome positioning using informative Multinomial-Dirichlet prior in a t-mixture with reversible jump estimation of nucleosome positions for genome-wide profiling.

Author(s)

Pascal Belleau, Rawane Samb, Astrid Deschênes, Khader Khadraoui, Lajmi Lakhal and Arnaud Droit

Maintainer: Astrid Deschenes `<adeschen@hotmail.com>`

- `rjmcmc` for profiling of nucleosome positions for a segment

- `rjmcmcCHR` for profiling of nucleosome positions for a large region. The function will take care of spliting and merging.

- `segmentation` for splitting a GRanges containing reads in a list of smaller segments for the rjmcmc function.

- `postTreatment` for merging closely positioned nucleosomes

- `mergeRDSFiles` for merging nucleosome information from selected RDS files.

- `plotNucleosomes` for generating a graph containing the nucleosome positions and the read coverage.

---

mergeAllRDSFilesFromDirectory

> *Merge nucleosome information from all RDS files present in a same directory. Beware that only nucleosome information from same chromosome should be merged together.*

Description

Merge nucleosome information, from all RDS files present in a same directory, into one object of class "rjmcmcNucleosomesMerge".

Usage

```
mergeAllRDSFilesFromDirectory(directory)
```

Arguments

directory   a character, the name of the directory (relative or absolute path) containing RDS files. The RDS files must contain R object of class "rjmcmcNucleosomes" or "rjmcmcNucleosomesMerge".

Value

a list of class "rjmcmcNucleosomesMerge" containing:

- k a integer, the number of nucleosomes.
- mu a GRanges containing the positions of the nucleosomes.

Author(s)

Pascal Belleau, Astrid Deschenes

Examples

```
## Use a directory present in the RJMCMC package
directoryWithRDSFiles <- system.file("extdata",
package = "RJMCMCNucleosomes")

## Merge nucleosomes info from RDS files present in directory
## It is assumed that all files present in the directory are nucleosomes
## result for the same chromosome
result <- mergeAllRDSFilesFromDirectory(directoryWithRDSFiles)

## Print the number and the position of the nucleosomes
result$k
result$mu

## Class of the output object
class(result)
```

---

mergeRDSFiles   *Merge nucleosome information from selected RDS files.*

Description

Merge nucleosome information present in RDS files into one object of class "rjmcmcNucleo-somesMerge".

Usage

```
mergeRDSFiles(RDSFiles)
```

Arguments

RDSFiles   a array, the names of all RDS used to merge nucleosome information. The
                files must contain R object of class "rjmcmcNucleosomes" or "rjmcmcNucle-osomesMerge".

Value

a list of class "rjmcmcNucleosomesMerge" containing:

- k a integer, the number of nucleosomes.
- mu a GRanges containing the positions of the nucleosomes.

Author(s)

Pascal Belleau, Astrid Deschenes

Examples

```
## Use RDS files present in the RJMCMC package
RDSFiles <- dir(system.file("extdata", package = "RJMCMCNucleosomes"),
full.names = TRUE, pattern = "*RDS")

## Merge nucleosomes info from RDS files present in directory
result <- mergeRDSFiles(RDSFiles)

## Print the number and the position of the nucleosomes
result$k
result$mu

## Class of the output object
class(result)
```

---

plotNucleosomes   *Generate a graph of nucleosome positions with read coverage*

Description

Generate a graph for a GRanges or a GRangesList of nucleosome positions. In presence of only one prediction (with multiples nucleosome positions), a GRanges is used. In presence of more thant one predictions (as example, before and after post-treatment or results from different software), a GRangesList with one entry per prediction is used. All predictions must have been obtained using the same reads.

Usage

```
plotNucleosomes(nucleosomePositions, reads, seqName = NULL,
  xlab = "position", ylab = "coverage", names = NULL)
```

Arguments

nucleosomePositions

a GRanges or a GRangesList containing the nucleosome positions for one or multiples predictions obtained using the same reads. In presence of only one prediction (with multiples nucleosome positions), a GRanges is used. In presence of more thant one predictions (as example, before and after post-treatment or results from different software), a GRangesList with one entry per prediction is used.

reads   a GRanges containing forward and reverse reads. The GRanges should contain at least one read.

seqName   a character string containing the label of the chromosome, present in the GRanges object, that will be used. The NULL value is accepted when only one seqname is present in the GRanges; the only seqname present will be used. Default: NULL.

xlab	a character string containing the label of the x-axis.
ylab	a character string containing the label of the y-axis.
names	a vector of a character string containing the label of each prediction set. The vector must be the same length of the nucleosomePositions list or 1 in presence of a vector. When NULL, the name of the elements of the list are used or the string "Nucleosome" for a vector are used. Default: NULL.

Value

a graph containing the nucleosome positions and the read coverage

Author(s)

Astrid Deschenes

Examples

```
## Load reads dataset
data(reads_demo_01)

## Run RJMCMC method
result <- rjmcmc(reads = reads_demo_01,
            seqName = "chr_SYNTHETIC",
            nbrIterations = 4000, lambda = 2, kMax = 30,
            minInterval = 146, maxInterval = 292, minReads = 5,
            vSeed = 10213)

## Create graph using the synthetic map
plotNucleosomes(nucleosomePositions = result$mu, seqName = "chr_SYNTHETIC",
            reads = reads_demo_01)
```

---

postTreatment	*A post-treatment function to merge closely positioned nucleosomes, from the same chromosome, identified by the* rjmcmc *function.*

Description

A helper function which merges closely positioned nucleosomes to rectify the over splitting and provide a more conservative approach. Beware that each chromosome must be treated separatly.

Usage

```
postTreatment(reads, seqName = NULL, resultRJMCMC, extendingSize = 74L,
  chrLength)
```

Arguments

reads	a GRanges containing forward and reverse reads. Beware that the start position of a reverse read is always higher that the end positition.
seqName	a character string containing the label of the chromosome, present in the GRanges object, that will be used. The NULL value is accepted when only one seqname is present in the GRanges; the only seqname present will be used. Default: NULL.
resultRJMCMC	an object of class "rjmcmcNucleosomes" or "rjmcmcNucleosomesMerge", the information about nucleosome positioning for an entire chromosome or a region that must be treated as one unit.
extendingSize	a positive numeric or a positive integer indicating the size of the consensus region used to group closeley positioned nucleosomes.The minimum size of the consensus region is equal to twice the value of the extendingSize parameter. The numeric will be treated as an integer. Default: 74.
chrLength	a positive numeric or a positive integer indicating the length of the current chromosome. The length of the chromosome is used to ensure that the consensus positions are all located inside the chromosome.

Value

a GRanges, the updated nucleosome positions. When no nucleosome is present, NULL is returned.

Author(s)

Pascal Belleau, Astrid Deschenes

Examples

```
## Loading dataset
data(reads_demo_02)

## Nucleosome positioning, running both merge and split functions
result <- rjmcmc(reads = reads_demo_02,
            seqName = "chr_SYNTHETIC", nbrIterations = 1000,
            lambda = 2, kMax = 30, minInterval = 146,
            maxInterval = 490, minReads = 3, vSeed = 11)

## Before post-treatment
result

##Post-treatment function which merged closely positioned nucleosomes
postResult <- postTreatment(reads = reads_demo_02,
                    seqName = "chr_SYNTHETIC", result, 100, 73500)

## After post-treatment
postResult
```

```
print.rjmcmcNucleosomes
```
Formated output of predicted nucleosomes

Description

Generated a formated output of a list marked as an rjmcmcNucleosomes class

Usage

```
## S3 method for class 'rjmcmcNucleosomes'
print(x, ...)
```

Arguments

x   the output object from rjmcmc function to be printed

...   arguments passed to or from other methods

Value

An object of class rjmcmcNucleosomes

Author(s)

Astrid Deschenes

Examples

```
## Loading dataset
data(RJMCMC_result)

print(RJMCMC_result)
```

```
print.rjmcmcNucleosomesBeforeAndAfterPostTreatment
```
Formated output of predicted nucleosomes

Description

Generated a formated output of a list marked as an rjmcmcNucleosomesBeforeAndAfterPostTreatment
class

Usage

```
## S3 method for class 'rjmcmcNucleosomesBeforeAndAfterPostTreatment'
print(x, ...)
```

Arguments

x	the output object from `rjmcmcCHR` function to be printed
...	arguments passed to or from other methods

Value

an object of class rjmcmcNucleosomesBeforeAndAfterPostTreatment

Author(s)

Astrid Deschenes

Examples

```
## Load synthetic dataset of reads
data(syntheticNucleosomeReads)

## Use dataset of reads to create GRanges object
sampleGRanges <- GRanges(syntheticNucleosomeReads$dataIP)

## Run nucleosome detection on the entire sample
## Not run: result <- rjmcmcCHR(reads = sampleGRanges, zeta = 147, delta=50,
maxLength=1200, nbrIterations = 1000, lambda = 3, kMax = 30,
minInterval = 146, maxInterval = 292, minReads = 5, vSeed = 10113,
nbCores = 2, saveAsRDS = FALSE)
## End(Not run)

## Print result
## Not run: print(result)
```

---

print.rjmcmcNucleosomesMerge

Formated output of predicted nucleosomes

Description

Generated a formated output of a list marked as an rjmcmcNucleosomesMerge class

Usage

```
## S3 method for class 'rjmcmcNucleosomesMerge'
print(x, ...)
```

Arguments

x	the output object from `mergeAllRDSFilesFromDirectory` function to be printed
...	arguments passed to or from other methods

Value

an object of class `mergeAllRDSFilesFromDirectory`

Author(s)

Astrid Deschenes

Examples

```
## Use a directory present in the RJMCMC package
directoryWithRDSFiles <- system.file("extdata",
package = "RJMCMCNucleosomes")

## Merge nucleosomes info from RDS files present in directory
## It is assumed that all files present in the directory are nucleosomes
## result for the same chromosome
result <- mergeAllRDSFilesFromDirectory(directoryWithRDSFiles)

## Show resulting nucleosomes
print(result)

## or simply
result
```

---

reads_demo_01   *Forward reads and reverse reads in* GRanges *format (for demo pur-*
                              pose).

Description

A group of forward and reverse reads, in a GRanges, that can be used to test the `rjmcmc` function.

Usage

```
data(reads_demo_01)
```

Format

A GRanges containing forward and reverse reads.

Value

A GRanges containing forward and reverse reads.

See Also

- [rjmcmc](#) for profiling of nucleosome positions

Examples

```
## Loading dataset
data(reads_demo_01)

## Nucleosome positioning
rjmcmc(reads = reads_demo_01, nbrIterations = 100, lambda = 3, kMax = 30,
            minInterval = 146, maxInterval = 292, minReads = 5)
```

---

reads_demo_02   *Forward reads and reverse reads in* GRanges *format (for demo pur-
                             pose).*

Description

A group of forward and reverse reads that can be used to test the rjmcmc function.

Usage

```
data(reads_demo_02)
```

Format

A GRanges containing forward and reverse reads.

Value

A GRanges containing forward and reverse reads.

See Also

- rjmcmc for profiling of nucleosome positions
- rjmcmcCHR for profiling of nucleosome positions for a large region. The function will take care of spliting and merging.
- segmentation for spliting a GRanges containing reads in a list of smaller segments for the rjmcmc function.
- postTreatment for merging closely positioned nucleosomes
- mergeRDSFiles for merging nucleosome information from selected RDS files.
- plotNucleosomes for generating a graph containing the nucleosome positions and the read coverage.

Examples

```
## Loading dataset
data(reads_demo_02)

## Nucleosome positioning
## Since there is only one chromosome present in reads_demo_02, the name
## of the chromosome does not need to be specified
rjmcmc(reads = reads_demo_02, nbrIterations = 150, lambda = 3, kMax = 30,
            minInterval = 144, maxInterval = 290, minReads = 6)
```

---

rjmcmc *Nucleosome positioning mapping on a segment*

Description

Use of a fully Bayesian hierarchical model for chromosome-wide profiling of nucleosome positions based on high-throughput short-read data (MNase-Seq data). Beware that for a genome-wide profiling, each chromosome must be treated separatly. This function is optimized to run on segments that are smaller sections of the chromosome.

Usage

```
rjmcmc(reads, seqName = NULL, nbrIterations, kMax, lambda = 3, minInterval,
    maxInterval, minReads = 5, adaptIterationsToReads = TRUE, vSeed = -1,
    saveAsRDS = FALSE)
```

Arguments

reads	a GRanges containing forward and reverse reads. Beware that the start position of a reverse read is always higher that the end positition.
seqName	a character string containing the label of the chromosome, present in the GRanges object, that will be used. The NULL value is accepted when only one seqname is present in the GRanges; the only seqname present will be used. Default: NULL.
nbrIterations	a positive integer or numeric, the number of iterations. Non-integer values of nbrIterations will be casted to integer and truncated towards zero.
kMax	a positive integer or numeric, the maximum number of degrees of freedom per region. Non-integer values of kMax will be casted to integer and truncated towards zero.
lambda	a positive numeric, the theorical mean of the Poisson distribution. Default: 3.
minInterval	a numeric, the minimum distance between two nucleosomes.
maxInterval	a numeric, the maximum distance between two nucleosomes.
minReads	a positive integer or numeric, the minimum number of reads in a potential canditate region. Non-integer values of minReads will be casted to integer and truncated towards zero. Default: 5.

adaptIterationsToReads

> a `logical` indicating if the number of iterations must be modified in function of the number of reads. Default: `TRUE`.

vSeed

> a `integer`. A seed used when reproducible results are needed. When a value inferior or equal to zero is given, a random integer is used. Default: -1.

saveAsRDS

> a `logical`. When `TRUE`, a RDS file containing the complete output of the c++ rjmcmc() function is created. Default : `FALSE`.

Value

a `list` of `class` "rjmcmcNucleosomes" containing:

- `call` the matched call.

- `k` a `integer`, the final estimation of the number of nucleosomes. `0` when no nucleosome is detected.

- `mu` a `GRanges` containing the positions of the nucleosomes and '*' as strand. The seqnames of the `GRanges` correspond to the `seqName` input value. `NA` when no nucleosome is detected.

- `k_max` a `integer`, the maximum number of nucleosomes obtained during the iteration process. `NA` when no nucleosome is detected.

Author(s)

Rawane Samb, Pascal Belleau, Astrid Deschenes

Examples

```
## Loading dataset
data(reads_demo_01)

## Nucleosome positioning, running both merge and split functions
result <- rjmcmc(reads = reads_demo_01, seqName = "chr_SYNTHETIC",
            nbrIterations = 1000, lambda = 2, kMax = 30,
            minInterval = 146, maxInterval = 292, minReads = 5,
            vSeed = 10113, saveAsRDS = FALSE)

## Print the final estimation of the number of nucleosomes
result$k

## Print the position of nucleosomes
result$mu

## Print the maximum number of nucleosomes obtained during the iteration
## process
result$k_max
```

---

rjmcmcCHR   *Nucleosome positioning mapping on a large segment, up to a chromo-some*

Description

Use of a fully Bayesian hierarchical model for chromosome-wide profiling of nucleosome positions based on high-throughput short-read data (MNase-Seq data). Beware that for a genome-wide profiling, each chromosome must be treated separatly. This function is optimized to run on an entire chromosome.

The function will process by splittingg the GRanges of reads (as example, the reads from a chromosome) in a list of smaller GRanges segments that can be run by the rjmcmc function. All those steps are done automatically.

Usage

```
rjmcmcCHR(reads, seqName = NULL, zeta = 147, delta, maxLength,
  nbrIterations, kMax, lambda = 3, minInterval, maxInterval, minReads = 5,
  adaptIterationsToReads = TRUE, vSeed = -1, nbCores = 1,
  dirOut = "out", saveAsRDS = FALSE, saveSEG = TRUE)
```

Arguments

reads	a GRanges, the forward and reverse reads that need to be segmented.
seqName	a character string containing the label of the chromosome, present in the GRanges object, that will be used. The NULL value is accepted when only one seqname is present in the GRanges; the only seqname present will be used. Default: NULL.
zeta	a positive integer or numeric, the length of the nucleosomes. Default: 147.
delta	a positive integer or numeric, the accepted range of overlapping section between segments. The overlapping section being zeta + delta.
maxLength	a positive integer or numeric, the length of each segment.
nbrIterations	a positive integer or numeric, the number of iterations. Non-integer values of nbrIterations will be casted to integer and truncated towards zero.
kMax	a positive integer or numeric, the maximum number of degrees of freedom per region. Non-integer values of kMax will be casted to integer and truncated towards zero.
lambda	a positive numeric, the theorical mean of the Poisson distribution. Default: 3.
minInterval	a numeric, the minimum distance between two nucleosomes.
maxInterval	a numeric, the maximum distance between two nucleosomes.
minReads	a positive integer or numeric, the minimum number of reads in a potential canditate region. Non-integer values of minReads will be casted to integer and truncated towards zero. Default: 5.

adaptIterationsToReads

a `logical` indicating if the number of iterations must be modified in function of the number of reads. Default: `TRUE`.

vSeed   a `integer`. A seed used when reproducible results are needed. When a value inferior or equal to zero is given, a random integer is used. Default: -1.

nbCores   a positive `integer`, the number of cores used to run in parallel. Default: 1.

dirOut   a `character` string. The name of the directory where 2 directories are created (if they don't already exists). The directory "dirOut/results" contents the rjmcmc results for each segment. The directory "dirOut/done" contents file a log file for each segment in RData format. If the log file for a segment is in the directory, the program considers that it is has been processed and run the next segment. Default: "out".

saveAsRDS   a `logical`. When `TRUE`, a RDS file containing the complete output of the `rjmcmc` function is created. Default: `FALSE`.

saveSEG   a `logical`. When `TRUE`, a RDS file containing the segments generated by segmentation function is saved in directory named from paramter `dirOut`. Default: `FALSE`.

Value

a `list` of class "rjmcmcNucleosomesBeforeAndAfterPostTreatment" containing:

- k a `integer`, the number of nucleosomes.
- mu a `GRanges` containing the positions of the nucleosomes.
- kPost a `integer`, the number of nucleosomes after post-treatment and '*' as strand. The seqnames of the `GRanges` correspond to the seqName input value. `NA` when no nucleosome is detected.
- muPost a `GRanges` containing the positions of the nucleosomes after post-treament and '*' as strand. The seqnames of the `GRanges` correspond to the seqName input value. `NA` when no nucleosome is detected.

Author(s)

Pascal Belleau, Astrid Deschenes

Examples

```
## Load synthetic dataset of reads
data(syntheticNucleosomeReads)

## Use dataset of reads to create GRanges object
sampleGRanges <- GRanges(syntheticNucleosomeReads$dataIP)

## Run nucleosome detection on the entire sample
## Not run: result <- rjmcmcCHR(reads = sampleGRanges, zeta = 147, delta=50,
maxLength=1200, nbrIterations = 1000, lambda = 3, kMax = 30,
minInterval = 146, maxInterval = 292, minReads = 5, vSeed = 10113,
nbCores = 2, saveAsRDS = FALSE)
```

```
## End(Not run)
```

RJMCMC_result   *Nucleosomes obtained by running RJMCMC function using reads*
                       from reads_demo_02 dataset (for demo purpose).

Description

A list of class "rjmcmcNucleosomes" which contains the information about the detected nucleosomes.

Usage

```
data(RJMCMC_result)
```

Format

A list of class "rjmcmcNucleosomes" containing:

- call the matched call.

- k a integer, the final estimation of the number of nucleosomes. 0 when no nucleosome is detected.

- mu a vector of numeric of length k, the positions of the nucleosomes. NA when no nucleosome is detected.

- k_max a integer, the maximum number of nucleosomes obtained during the iteration process. NA when no nucleosome is detected.

Value

A list of class "rjmcmcNucleosomes" containing:

- call the matched call.

- k a integer, the final estimation of the number of nucleosomes. 0 when no nucleosome is detected.

- mu a vector of numeric of length k, the positions of the nucleosomes. NA when no nucleosome is detected.

- k_max a integer, the maximum number of nucleosomes obtained during the iteration process. NA when no nucleosome is detected.

See Also

- `rjmcmc` for profiling of nucleosome positions
- `rjmcmcCHR` for profiling of nucleosome positions for a large region. The function will take care of spliting and merging.
- `segmentation` for splitting a GRanges containing reads in a list of smaller segments for the rjmcmc function.
- `postTreatment` for merging closely positioned nucleosomes
- `mergeRDSFiles` for merging nucleosome information from selected RDS files.
- `plotNucleosomes` for generating a graph containing the nucleosome positions and the read coverage.

Examples

```
## Loading dataset
data(RJMCMC_result)
data(reads_demo_02)

## Results before post-treatment
RJMCMC_result$mu

## Post-treatment function which merged closely positioned nucleosomes
postResult <- postTreatment(reads = reads_demo_02,
    extendingSize = 60, chrLength = 100000, resultRJMCMC = RJMCMC_result)

## Results after post-treatment
postResult
```

---

segmentation	*Split a* GRanges *containing reads in a list of smaller segments for the* rjmcmc *function.*

Description

Split a GRanges of reads (as example, the reads from a chromosome) in a `list` of smaller GRanges sot that the `rjmcmc` function can be run on each segments.

Usage

```
segmentation(reads, zeta = 147, delta, maxLength)
```

Arguments

reads	a GRanges, the reads that need to be segmented.
zeta	a positive integer or numeric, the length of the nucleosomes. Default: 147.
delta	a positive integer or numeric, the accepted range of overlapping section between segments. The overlapping section being zeta + delta.
maxLength	a positive integer or numeric, the length of each segment.

Value

a GRangesList containing all the segments.

Author(s)

Pascal Belleau, Astrid Deschenes

Examples

```
## Load synthetic dataset of reads
data(syntheticNucleosomeReads)

## Use dataset of reads to create GRanges object
sampleGRanges <- GRanges(seqnames = syntheticNucleosomeReads$dataIP$chr,
    ranges = IRanges(start = syntheticNucleosomeReads$dataIP$start,
    end = syntheticNucleosomeReads$dataIP$end),
    strand = syntheticNucleosomeReads$dataIP$strand)

# Segmentation of the reads
segmentation(reads = sampleGRanges, zeta = 147, delta = 50,
maxLength = 1000)
```

---

syntheticNucleosomeReads

Simulated dataset of reads generated by nucleoSim *package (for demo purpose).*

Description

A list of class "syntheticNucReads" which contains the information about synthetic reads related to nucleosomes. The datset has been created using a total of 300 well-positioned nucleosomes, 30 fuzzy nucleosomes with variance of reads following a Normal distribution.

Usage

```
data(syntheticNucleosomeReads)
```

Format

A list containing:

- call the called that generated the dataset.
- dataIP a data.frame with the chromosome name, the starting and ending positions and the direction of all forward and reverse reads for all well-positioned and fuzzy nucleosomes. Paired-end reads are identified with an unique id.
- wp a data.frame with the positions of all the well-positioned nucleosomes, as well as the number of paired-reads associated to each one.

- fuz a data.frame with the positions of all the fuzzy nucleosomes, as well as the number of paired-reads associated to each one.
- paired a data.frame with the starting and ending positions of the reads used to generate the paired-end reads. Paired-end reads are identified with an unique id.

Value

A list containing:

- call the called that generated the dataset.
- dataIP a data.frame with the chromosome name, the starting and ending positions and the direction of all forward and reverse reads for all well-positioned and fuzzy nucleosomes. Paired-end reads are identified with an unique id.
- wp a data.frame with the positions of all the well-positioned nucleosomes, as well as the number of paired-reads associated to each one.
- fuz a data.frame with the positions of all the fuzzy nucleosomes, as well as the number of paired-reads associated to each one.
- paired a data.frame with the starting and ending positions of the reads used to generate the paired-end reads. Paired-end reads are identified with an unique id.
