

# Package ‘rBiopaxParser’

May 25, 2024

**Type** Package

**Title** Parses BioPax files and represents them in R

**Version** 2.45.0

**Date** 2020-07-14

**Author** Frank Kramer

**Maintainer** Frank Kramer <frank.kramer@informatik.uni-augsburg.de>

**Description** Parses BioPAX files and represents them in R, at the moment BioPAX level 2 and level 3 are supported.

**License** GPL (>= 2)

**Depends** R (>= 4.0), data.table

**Imports** XML

**Suggests** Rgraphviz, RCurl, graph, RUnit, BiocGenerics, RBGL, igraph

**URL** <https://github.com/frankkramer-lab/rBiopaxParser>

**biocViews** DataRepresentation

**RoxygenNote** 7.1.1

**git\_url** <https://git.bioconductor.org/packages/rBiopaxParser>

**git\_branch** devel

**git\_last\_commit** 2fec4ac

**git\_last\_commit\_date** 2024-04-30

**Repository** Bioconductor 3.20

**Date/Publication** 2024-05-24

rBiopaxParser-package *Parses BioPax level files and represents them in R*

---

## Description

Parses BioPax files and represents them in R

## Details

rBiopaxParser is a...

Package: rBiopaxParser  
 Type: Package  
 Version: 0.15  
 Date: 2012-08-22  
 License: GPL (>= 2)

## Author(s)

Frank Kramer <dev@frankkramer.de>

**Examples**

```
## Not run: biopax = readBiopax(file="biopaxmodel.owl")
```

---

```
addBiochemicalReaction
```

*This function adds a new biochemical reaction to the biopax model.*

---

**Description**

This function adds a new biochemical reaction of class `biochemicalReaction` to the biopax model. This is a convenience function, internally the function `addBiopaxInstance` is called with properties `LEFT` and `RIGHT` set.

**Usage**

```
addBiochemicalReaction(biopax, LEFT = c(), RIGHT = c(), id = NULL)
```

**Arguments**

<code>biopax</code>	A biopax model
<code>LEFT</code>	vector of strings. IDs of the <code>physicalEntityParticipant</code> instances that are on the left side of this reaction.
<code>RIGHT</code>	vector of strings. IDs of the <code>physicalEntityParticipant</code> instances that are on the right side of this reaction.
<code>id</code>	string. ID for the control. If <code>NULL</code> a new ID is generated with prefix "biochemicalReaction".

**Value**

Returns the biopax model with the added pathway.

**Author(s)**

fkramer

**Examples**

```
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax$dt
```

---

addBiopaxInstance      *This function adds a new instance to an existing biopax model.*

---

### Description

This function adds a new instance to an existing biopax model. "properties" is a named list of vectors, with the vector name as the name of the property and every entry of the vector a property value. Please note: case sensitivity! In Biopax Level 2 all properties are written in all capital letters. This will change in Biopax Level 3.

### Usage

```
addBiopaxInstance(  
  biopax,  
  class,  
  id,  
  properties = list(NAME = c()),  
  verbose = TRUE  
)
```

### Arguments

biopax	A biopax model
class	string. Class name
id	string. ID of the instance
properties	named list of properties.
verbose	logical. Be verbose about what was added.

### Value

Returns the supplied biopax model with the new instance added.

### Author(s)

Frank Kramer

### Examples

```
biopax = createBiopax(level=2)  
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",SYNONYMS="p1"))  
biopax$dt
```

---

addBiopaxInstances      *This function adds new instances to an existing biopax model.*

---

### Description

This function adds new instances (supplied as a compatible `data.table`) to an existing biopax model via `rbind`. Usually you want to start out at `createBiopax` and `addPhysicalEntity` and work your way up the ontology ladder.

### Usage

```
addBiopaxInstances(biopax, newInstanceDF)
```

### Arguments

`biopax`              A biopax model  
`newInstanceDF`      `data.table` or `data.frame`. Must be compatible with internal biopax implementation.

### Value

Returns the supplied biopax model with the new instances added.

### Author(s)

Frank Kramer

### Examples

```
# load data
data(biopaxexample)
biopax_temp = createBiopax(level=2)
biopax_temp = addBiopaxInstance(biopax_temp, class="protein", id="id1", properties=list(NAME="protein1",SYNONYM
selectInstances(biopax_temp)
biopax = addBiopaxInstances(biopax, selectInstances(biopax_temp))
```

---

addControl              *This function adds a new control to the biopax model.*

---

### Description

This function adds a new interaction of class `control` to the biopax model. This is a convenience function to add controls, internally the function `addBiopaxInstance` is called with properties `CONTROL-TYPE`, `CONTROLLER` and `CONTROLLED` set.

**Usage**

```

addControl(
  biopax,
  CONTROL_TYPE = c("ACTIVATION", "INHIBITION"),
  CONTROLLER = "",
  CONTROLLED = c(),
  id = NULL
)

```

**Arguments**

biopax	A biopax model
CONTROL_TYPE	string. Specifies whether this is an activating or inhibiting control.
CONTROLLER	string. ID of the physicalEntityParticipant instance that is the controller of this interaction.
CONTROLLED	vector of strings. IDs of the interaction and/or pathway instances that are being controlled.
id	string. ID for the control. If NULL a new ID is generated with prefix "control".

**Value**

Returns the biopax model with the added pathway.

**Author(s)**

fkramer

**Examples**

```

biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_
biopax$dt

```

addhash *Adds a hash in front of a string*

---

**Description**

Adds a hash in front of a string

**Usage**

```
addhash(x)
```

**Arguments**

x                    A string to be preceeded by a hash

**Value**

The supplied string with a hash "#" pasted in front of it.

**Author(s)**

Frank Kramer

---

addns *Add a namespace tag to the supplied classname string*

---

**Description**

This function takes the input classname, checks if it already has a namespace, and if not pastes the namespace tag with a dividing ":" in front of it.

**Usage**

```
addns(classname, namespace = "bp")
```

**Arguments**

classname            A string containing a classname  
namespace            A string containing a namespace

**Value**

If the classname is not preceeded by a namespace yet, the supplied namespace is pasted in front of it and returned.

**Author(s)**

Frank Kramer

---

addPathway	<i>This function adds a new pathway to the biopax model.</i>
------------	--

---

### Description

This function adds a new pathway + its PATHWAY-COMPONENTS (references to interaction/pathways/pathwaySteps)

### Usage

```
addPathway(
  biopax,
  NAME,
  PATHWAY_COMPONENTS = c(),
  id = NULL,
  ORGANISM = NULL,
  COMMENT = NULL
)
```

### Arguments

biopax	A biopax model
NAME	string. Name of the pathway
PATHWAY_COMPONENTS	character vector. IDs of the pathway components. This must be IDs of instances of type interaction/pathway/pathwayStep (or their subclasses).
id	string. ID for the pathway. If NULL a new ID is generated with prefix "pathway".
ORGANISM	string. Organism property of the pathway. optional.
COMMENT	string. An optional comment

### Value

Returns the biopax model with the added pathway.

### Author(s)

fkramer

### Examples

```
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
```

```

biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_
biopax = addPathway(biopax, NAME="mypathway1", PATHWAY_COMPONENTS=c("c_id1"), id="pw_id1")
biopax$dt

```

---

addPathwayComponents *This function adds pathway components to an existing pathway*

---

## Description

This function adds pathway components to an existing pathway. Property PATHWAY-COMPONENTS are references to IDs of interaction/pathways/pathwaySteps (or subclasses of those)

## Usage

```
addPathwayComponents(biopax, id, PATHWAY_COMPONENTS = c())
```

## Arguments

biopax	A biopax model
id	string. ID for the pathway
PATHWAY_COMPONENTS	character vector. IDs of the pathway components. This must be IDs of instances of type interaction/pathway/pathwayStep (or their subclasses).

## Value

Returns the biopax model with the pathway components added to the pathway

## Author(s)

fkramer

## Examples

```

biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_
biopax = addPathway(biopax, NAME="mypathway1", PATHWAY_COMPONENTS=c(), id="pw_id1")
biopax = addPathwayComponents(biopax, id="pw_id1", PATHWAY_COMPONENTS=c("c_id1"))
biopax$dt

```

---

addPhysicalEntity      *This function adds a new physical entity.*

---

### Description

This function adds a new physical entity of chosen class to the biopax model. This is a convenience function to add physical entities, internally the function addBiopaxInstance is called with properties NAME and ORGANISM set.

### Usage

```
addPhysicalEntity(  
  biopax,  
  class = c("dna", "rna", "protein", "smallMolecule", "complex")[1],  
  NAME,  
  id = NULL,  
  ORGANISM = NULL,  
  COMMENT = NULL  
)
```

### Arguments

biopax	A biopax model
class	string. Class of the physical entity to add, choose from c("dna","rna","protein","smallMolecule","complex")
NAME	string. Name of the new physical entity
id	string. ID for the physical entity. If NULL a new ID is generated with prefix "physicalEntity".
ORGANISM	string. Organism property of the molecule. optional.
COMMENT	string. An optional comment

### Value

Returns the biopax model with the added physical entity.

### Author(s)

fkramer

### Examples

```
biopax = createBiopax(level=2)  
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",COMMENT="this is my  
biopax$dt  
biopax = addPhysicalEntity(biopax, class="protein", id="id2", NAME="protein2", COMMENT="This is a protein added us  
biopax$dt
```

---

addPhysicalEntityParticipant

*This function adds a new physical entity participant.*

---

### Description

This function adds a new physical entity participant instance, which is a placeholder for physicalEntity class instances in interactions. This is a convenience function to add physicalEntityParticipant instances, internally the function addBiopaxInstance is called.

### Usage

```
addPhysicalEntityParticipant(biopax, referencedPhysicalEntityID, id = NULL)
```

### Arguments

biopax	A biopax model
referencedPhysicalEntityID	string. ID the new physicalEntity instance to reference here.
id	string. ID for the physical entity participant. If NULL a new ID is generated with prefix "physicalEntityParticipant".

### Value

Returns the biopax model with the added physicalEntityParticipant.

### Author(s)

fkramer

### Examples

```
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id1")
biopax$dt
```

---

`addPropertiesToBiopaxInstance`*This function adds new properties to an existing biopax instance.*

---

**Description**

This function adds new properties to an existing biopax instance.

**Usage**

```
addPropertiesToBiopaxInstance(biopax, id, properties)
```

**Arguments**

<code>biopax</code>	A biopax model
<code>id</code>	string. ID of the instance
<code>properties</code>	named list of properties.

**Value**

Returns the supplied biopax model with new properties added to this instance.

**Author(s)**

Frank Kramer

**Examples**

```
biopax = createBiopax(level=2)
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",SYNONYMS="p1"))
biopax$dt
biopax = addPropertiesToBiopaxInstance(biopax, id="id1", properties=list(COMMENT="this is my first protein!"))
biopax$dt
```

---

`biopax`*Biopax example data set*

---

**Description**

A dataset containing two regulatory pathways encoded in Biopax Level 2 and parsed in via `readBiopax()`.

Another dataset containing pathways encoded in Biopax Level 2 and parsed in via `readBiopax()`.

**Format**

An example biopax model parsed in via readBiopax.

An example biopax model parsed in via readBiopax.

**Examples**

```
data(biopaxexample)
biopax
data(biopaxLevel3Example)
biopax
```

---

calcGraphOverlap	<i>This function calculates the overlap of 2 graphs</i>
------------------	---

---

**Description**

This function calculates the overlap of supplied graph1 with graph2. Layout and weights of graph1 are kept.

**Usage**

```
calcGraphOverlap(graph1, graph2)
```

**Arguments**

graph1	graphNEL
graph2	graphNEL

**Value**

Returns a list containing the compared graphs and edge- and node-wise overlap between them.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
calcGraphOverlap(mygraph1, mygraph2)
```

---

checkValidity	<i>This function checks the supplied biopax model for validity.</i>
---------------	---

---

**Description**

This function checks the supplied biopax model for validity, concerning classes, properties, etc. Not yet implemented. Called internally by writeBiopax.

**Usage**

```
checkValidity(biopax)
```

**Arguments**

biopax            A biopax model

**Value**

logical. Returns TRUE is the biopax model is valid Biopax Level 2, or FALSE otherwise.

**Author(s)**

Frank Kramer

---

CLASS\_INHERITANCE\_BP2    *CLASS\_INHERITANCE\_BP2*

---

**Description**

Class inheritance relationships in Biopax Level 2.

**Usage**

```
CLASS_INHERITANCE_BP2
```

**Format**

A data frame with 46 rows and 2 columns

**Details**

A data.frame listing all direct superclasses for every Biopax Level 2 class. The variables are as follows:

- class. Name of the class
- superclass. Name of the superclass

---

CLASS\_INHERITANCE\_BP3 *CLASS\_INHERITANCE\_BP3*

---

**Description**

Class inheritance relationships in Biopax Level 3.

**Usage**

CLASS\_INHERITANCE\_BP3

**Format**

A data frame with 46 rows and 2 columns

**Details**

A data.frame listing all direct superclasses for every Biopax Level 3 class. The variables are as follows:

- class. Name of the class
- superclass. Name of the superclass

NOT UPDATED TO BP3 yet!

---

CLASS\_PROPERTIES\_BP2 *CLASS\_PROPERTIES\_BP2*

---

**Description**

Class properties in Biopax Level 2.

**Usage**

CLASS\_PROPERTIES\_BP2

**Format**

A data frame with 106 rows and 4 columns

**Details**

A data.frame listing all direct properties for every Biopax Level 2 class. Together with CLASS\_INHERITANCE\_BP2 this allows to list all properties, including the inherited ones, of every class.

The variables are as follows:

- class. Name of the class
- property. Name of the superclass
- property\_type. Type of the property, value or reference
- cardinality. Maximum allowed cardinality of a property. Many properties may only be singular.

---

CLASS\_PROPERTIES\_BP3    *CLASS\_PROPERTIES\_BP3*

---

**Description**

Class properties in Biopax Level 3.

**Usage**

CLASS\_PROPERTIES\_BP3

**Format**

A data frame with 106 rows and 4 columns

**Details**

A data.frame listing all direct properties for every Biopax Level 3 class. Together with CLASS\_INHERITANCE\_BP3 this allows to list all properties, including the inherited ones, of every class.

The variables are as follows:

- class. Name of the class
- property. Name of the superclass
- property\_type. Type of the property, value or reference
- cardinality. Maximum allowed cardinality of a property. Many properties may only be singular.

---

colorGraphNodes	<i>This function colors the nodes of a graph.</i>
-----------------	---

---

### Description

This function colors nodes of a graph, usually this is used to color subgraphs or add a color hue correlating with the expression level or fold change to the molecules.

### Usage

```
colorGraphNodes(graph1, nodes, values, colors = c("greenred", "yellowred"))
```

### Arguments

graph1	graphNEL
nodes	vector of node names specifying which nodes to color. must be same length as parameter foldChanges
values	vector of values indicating fold changes, gene expression values or similar. colors are mapped linearly over the range of these values
colors	string. either "greenred" or "yellowred", specifying which color gradient to use.

### Value

Returns a graph with specified nodes colored according to the foldChanges

### Author(s)

Frank Kramer

### Examples

```
# load data and retrieve wnt pathway
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph1 = layoutRegulatoryGraph(mygraph1)
# retrieve all nodes
nodes = nodes(mygraph1)
# random expression data for your nodes
values = rnorm(length(nodes), mean=6, sd=2)
# color nodes of the graph
mygraph1 = colorGraphNodes(mygraph1, nodes, values, colors="greenred")
# plot the now colored graph
plotRegulatoryGraph(mygraph1, layoutGraph=FALSE)
```

---

combineNodes	<i>This function gracefully combines nodes of a regulatory graph.</i>
--------------	---

---

### Description

This gracefully combines nodes from a regulatory graph. This is basically a wrapper for `graph::combineNodes(nodes, graph, newName, collapseFunction=max)`. If there are duplicated edges for the nodes, the maximum edgeweight will be used for the new connection.

### Usage

```
combineNodes(nodes, graph, newName)
```

### Arguments

nodes	vector of node names specifying which nodes to combine.
graph	graphNEL
newName	string. Name of the newly created node that will combine the specified nodes.

### Value

Returns a graph with specified nodes removed.

### Author(s)

Frank Kramer

### Examples

```
# load data and retrieve wnt pathway
data(biopaxexample)
```

---

createBiopax	<i>This function creates a new Biopax model from scratch</i>
--------------	--

---

### Description

This function creates a new Biopax model from scratch. This is not necessary if you want to parse a BioPAX export from a file, please see: `readBiopax`. Returns a biopax model, which is a list with named elements:

**df** The data.frame representing the biopax in R  
**ns\_rdf** RDF Namespace  
**ns\_owl** OWL Namespace  
**ns\_bp** Biopax Namespace  
**file** NULL

**Usage**

```
createBiopax(level = 3)
```

**Arguments**

level            integer. Specifies the BioPAX level.

**Value**

A biopax model

**Author(s)**

Frank Kramer

**Examples**

```
biopax = createBiopax(level=2)
```

---

DATABASE\_BIOPAX

*DATABASE\_BIOPAX*

---

**Description**

Databases available for direct download via `downloadBiopaxData`

**Usage**

```
DATABASE_BIOPAX
```

**Format**

A data frame with 46 rows and 4 columns

**Details**

A data.frame listing all available databases which can be directly downloaded (Homo Sapiens only) via function `downloadBiopaxData`. The variables are as follows:

- database. Name of the database
- model. Name of the ontology model
- version. Biopax level
- link. Link to the direct download

---

diffGraphs	<i>This function returns the different nodes and edges between graph1 and graph2.</i>
------------	---

---

### Description

This function returns the different nodes and edges between graph1 and graph2. Layout options of graph1 are kept. Coloring currently not implemented.

### Usage

```
diffGraphs(graph1, graph2, colorNodes = TRUE, colors = c("#B3E2CD", "#FDCDAC"))
```

### Arguments

graph1	graphNEL
graph2	graphNEL
colorNodes	logical
colors	character vector of colors. If colorNodes==TRUE these colors are used for graph1 and graph2 respectively.

### Value

Return the diff between the graphs.

### Author(s)

Frank Kramer

### Examples

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(diffGraphs(mygraph1,mygraph2))
```

---

downloadBiopaxData      *This function downloads Biopax data from online databases*

---

### Description

This function has an internal list of download links for some online databases. It will retrieve the selected model from the selected database using RCurl. The downloaded file is (if needed) unzipped and ready to be used as input for `rBiopaxParser::readBiopax`. This function requires package RCurl to run. You can easily skip this step by downloading the exported file yourself and continuing with `readBiopax`.

### Usage

```
downloadBiopaxData(  
  database = "NCI",  
  model = c("pid", "biocarta", "reactome", "kegg"),  
  outputfile = "",  
  version = "biopax2"  
)
```

### Arguments

database	string. Select which database you want to download from. Currently only NCI links have been stored.
model	string. Select which model/file you want to download. Currently NCI versions of the Pathway Interaction Database, Biocarta, Reactome and KEGG are linked.
outputfile	string. The file name to save the downloaded data in. If left empty the URL file name will be used. The unzipped file name can be different from this. Check the screen output of gunzip.
version	string. Select which Biopax Version you want to download.

### Value

none. Check output for the name of the unzipped biopax .owl file.

### Author(s)

fkramer

### Examples

```
## Not run: file = downloadBiopaxData("NCI", "biocarta", version = "biopax2")  
## Not run: biopax = readBiopax(file)  
## Not run: biopax
```

---

generateNewUniqueID     *This function generates a new unique id for a biopax model*

---

**Description**

This function generates a new unique id for a biopax model. Pass it an starting point like "pathway" or "protein" to get a niceer looking id.

**Usage**

```
generateNewUniqueID(biopax, id = "")
```

**Arguments**

biopax	A biopax model
id	string. This is used as a prefix for the id.

**Value**

Returns an unused unique ID.

**Author(s)**

fkramer

---

getClassProperties     *This function returns the properties of the supplied biopax class.*

---

**Description**

This function returns the properties of the supplied biopax class. It always considers inheritance. Every class inherits the properties of its super classes. A table listing all available properties and their cardinalities (for Biopax Level 2).

**Usage**

```
getClassProperties(classname, biopaxlevel = 3)
```

**Arguments**

classname	A string containing a class name
biopaxlevel	Numeric. Specifies the Biopax Level to use.

**Value**

Returns a data.frame containing the properties and cardinalities of the supplied class

**Author(s)**

Frank Kramer

**Examples**

```
getClassProperties("control")
```

---

getInstanceClass	<i>This function returns the class name of the instance.</i>
------------------	--

---

**Description**

This function returns the class name of the instance.

**Usage**

```
getInstanceClass(biopax, id)
```

**Arguments**

biopax	A biopax model
id	string

**Value**

Returns the class name of the biopax instance.

**Author(s)**

fkramer

**Examples**

```
# load data
data(biopaxexample)
getInstanceClass(biopax, id="ex_m_100650")
```

---

getInstanceProperty     *This function returns all properties of the specified type for an instance.*

---

### Description

This function returns all properties of the specified type for an instance. By default this function returns the NAME property of an instance.

### Usage

```
getInstanceProperty(  
  biopax,  
  id,  
  property = "NAME",  
  includeAllNames = TRUE,  
  biopaxlevel = 3  
)
```

### Arguments

biopax	A biopax model
id	string
property	string.
includeAllNames	logical. Biopax Level 3 brought 2 new name properties: displayName and standardName. Per default this return all names of an instance. Disable if you only want the NAME property.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

### Value

Returns a character vector with all properties of the selected type for this instance. Returns NULL if no property data is found.

### Author(s)

fkramer

### Examples

```
# load data  
data(biopaxexample)  
getInstanceProperty(biopax, id="ex_m_100650", property="NAME")  
getInstanceProperty(biopax, id="ex_m_100650", property="ORGANISM")  
getInstanceProperty(biopax, id="ex_m_100650", property="COMPONENTS")
```

---

getNeighborhood	<i>This function returns the neighborhood of a physicalEntity</i>
-----------------	---

---

**Description**

This function searches the supplied biopax for interactions that are connected to the molecule or within 'depth' number of steps from it.

**Usage**

```
getNeighborhood(biopax, id, depth = 1, onlyInPathways = c(), biopaxlevel = 3)
```

**Arguments**

biopax	A biopax model
id	string. ID of a physicalEntity (dna, rna, protein, complex, smallMolecule)
depth	integer. Search depth, this specifies how far out from the specified molecule the neighborhood should be stretched.
onlyInPathways	character vector of pathway IDs. Search only in these pathways for neighbors.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns ids of interactions within 'depth' number of steps of the specified physicalEntity

**Author(s)**

fkramer

---

getParticipants	<i>This function is used internally by pathway2Graph to obtain physical entities participating in an interaction.</i>
-----------------	---

---

**Description**

This function is used internally by pathway2Graph to obtain physical entities participating in an interaction.

**Usage**

```
getParticipants(
  pwComponentList,
  instance,
  biopaxlevel,
  splitComplexMolecules = FALSE,
  useIDasNodenames = TRUE
)
```

**Arguments**

pwComponentList	List of pathway components
instance	Biopax instance id
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.
splitComplexMolecules	logical. If TRUE complexes are split up into their components and the annotation of the components is added.
useIDasNodenames	logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.

**Author(s)**

Nirupama Benis

---

getReferencedIDs	<i>This function returns a vector of ids of all instances referenced by the specified instance.</i>
------------------	---

---

**Description**

This function takes an id and a biopax model as input. The id of every instance that is referenced is returned. If recursive == TRUE this function recurses through all referenced IDs of the referenced instances and so on. "onlyFollowProperties" limits the recursiveness to only certain properties, for example follow only complexes or physicalEntities.

**Usage**

```
getReferencedIDs(biopax, id, recursive = TRUE, onlyFollowProperties = c())
```

**Arguments**

biopax	A biopax model OR a compatible data.table
id	string. ID of the instance
recursive	logical
onlyFollowProperties	character vector

**Value**

Returns a character vector of IDs referenced by the supplied id in the supplied biopax model.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
getReferencedIDs(biopax, id="ex_m_100650", recursive=FALSE)
getReferencedIDs(biopax, id="ex_m_100650", recursive=TRUE)
```

---

getReferencingIDs	<i>This function returns a vector of ids of all instances that reference the supplied id.</i>
-------------------	---

---

**Description**

This function takes an id and a biopax model as input. The id of every instance that references the supplied id is returned. If recursive == TRUE this function recurses through all referencing IDs of the referencing instances and so on. "onlyFollowProperties" limits the recursiveness to only certain properties, for example follow only complexes or physicalEntities.

**Usage**

```
getReferencingIDs(biopax, id, recursive = TRUE, onlyFollowProperties = c())
```

**Arguments**

biopax	A biopax model
id	string. ID of the instance
recursive	logical
onlyFollowProperties	character vector

**Value**

Returns a character vector of IDs referencing the supplied id in the supplied biopax model.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
getReferencingIDs(biopax, id="ex_m_100650", recursive=FALSE)
getReferencingIDs(biopax, id="ex_m_100650", recursive=TRUE)
```

---

getSubClasses	<i>This function returns the subclasses of the supplied biopax class.</i>
---------------	---

---

**Description**

This function returns the subclasses of the supplied biopax class.

**Usage**

```
getSubClasses(classname, biopaxlevel = 3)
```

**Arguments**

classname	A string containing a class name
biopaxlevel	Numeric. Specifies the Biopax Level to use.

**Value**

Returns character vector containing the subclasses of the supplied class

**Author(s)**

Frank Kramer

**Examples**

```
getSubClasses("control")
```

---

getSuperClasses	<i>This function returns the superclasses of the supplied biopax class.</i>
-----------------	---

---

**Description**

This function returns the superclasses of the supplied biopax class.

**Usage**

```
getSuperClasses(classname, biopaxlevel = 3)
```

**Arguments**

classname	A string containing a class name
biopaxlevel	Numeric. Specifies the Biopax Level to use.

**Value**

Returns character vector containing the superclasses of the supplied class

**Author(s)**

Frank Kramer

**Examples**

```
getSuperClasses("control")
```

---

`getXrefAnnotations`      *This function returns the annotations of the supplied instances.*

---

**Description**

This function returns the annotations of the supplied IDs in a `data.table`.

**Usage**

```
getXrefAnnotations(  
  biopax,  
  id,  
  splitComplexes = FALSE,  
  followPhysicalEntityParticipants = TRUE,  
  biopaxlevel = 3  
)
```

**Arguments**

<code>biopax</code>	A biopax model
<code>id</code>	vector of strings. IDs of instances to get annotations
<code>splitComplexes</code>	logical. If TRUE complexes are split up into their components and the annotation of the components is added.
<code>followPhysicalEntityParticipants</code>	logical. If TRUE <code>physicalEntityParticipants</code> are resolved to their corresponding <code>physicalEntities</code> and their annotation is added.
<code>biopaxlevel</code>	integer. Set the biopax level here if you supply a <code>data.table</code> directly.

**Value**

Returns `data.table` with annotations

**Author(s)**

fkramer

**Examples**

```
# load data
data(biopaxexample)
# example of annotation for a protein:
getXrefAnnotations(biopax, id="ex_m_100647")
# no annotations for exactly the complex
getXrefAnnotations(biopax, id="ex_m_100650")
# split up the complex and get annotations for all the molecules involved
getXrefAnnotations(biopax, id="ex_m_100650", splitComplexes=TRUE)
```

---

hasProperty	<i>Checks if instances in the biopax data.table have a given property</i>
-------------	---

---

**Description**

Checks if instances in the biopax data.table have a given property

**Usage**

```
hasProperty(df, property)
```

**Arguments**

df	A data.frame with biopax instances
property	A string containing the name of the property to check for

**Value**

Returns TRUE for every row in the data.frame with contains the supplied property. Logical vector with length corresponding to the number of rows in the data.frame.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
```

internal\_checkArguments

*This function checks the supplied arguments if they abide to the given restrictions*

---

### **Description**

This function checks the supplied arguments if they abide to the given restrictions

### **Usage**

```
internal_checkArguments(  
  args = c(),  
  allowedValues = list(),  
  allowNULL = FALSE,  
  allowNA = FALSE,  
  allowEmptyString = TRUE,  
  allowInf = TRUE  
)
```

### **Arguments**

args	The vector of arguments to check
allowedValues	A named list of values the argument of a this name is allowed to have
allowNULL	Logical, allow NULL or not
allowNA	Logical, allow NA or not
allowEmptyString	Logical, allow empty strings or not
allowInf	Logical, allow values of +/- infinity or not

### **Value**

Returns 1 if all checks completed successfully, returns error message otherwise.

### **Author(s)**

Frank Kramer

---

`internal_generateXMLfromBiopax`*This function generates the xmlTree from the supplied biopax model.*

---

**Description**

This function is used internally by writeBiopax. It can also be called directly with a fitting dataframe in `list(df=data.frame())`, but this will probably break things.

**Usage**

```
internal_generateXMLfromBiopax(biopax, namespaces = namespaces, verbose = TRUE)
```

**Arguments**

<code>biopax</code>	A biopax model
<code>namespaces</code>	A list of namespaces to use for the generated XML/RDF file
<code>verbose</code>	logical

**Value**

Returns the xmlTree generated from the supplied biopax model.

**Author(s)**

Frank Kramer

---

`internal_getBiopaxModelAsDataFrame`*This internal function parses the Biopax XML of the supplied biopax model and returns it in the data.frame format.*

---

**Description**

This internal function parses the Biopax XML of the supplied biopax model and returns it in the data.frame format.

**Usage**

```
internal_getBiopaxModelAsDataFrame(biopax, biopaxxml, verbose = TRUE)
```

**Arguments**

<code>biopax</code>	A biopax object
<code>biopaxxml</code>	Biopax XML file read in. See parseBiopax
<code>verbose</code>	logical

**Value**

Returns the parsed biopax model in the internal data.frame format.

**Author(s)**

Frank Kramer

---

internal\_NrOfXMLNodes *This function is an internal function to count the Number of nodes and child nodes of an XMLNode.*

---

**Description**

This function is an internal function to count the Number of nodes and child nodes of an XMLNode.

**Usage**

```
internal_NrOfXMLNodes(myXMLNode)
```

**Arguments**

myXMLNode      XMLNode to analyze

**Value**

This function returns the number of Nodes and child Nodes an XMLNode has.

**Author(s)**

Frank Kramer

---

internal\_propertyListToDF  
*Internal function to build a data.frame from the list of properties for a new instance*

---

**Description**

Internal function to build a data.frame from the list of properties for a new instance

**Usage**

```
internal_propertyListToDF(  
  class,  
  id,  
  properties,  
  namespace_rdf = "rdf",  
  biopaxlevel = 2  
)
```

**Arguments**

class	string. Class name
id	string. ID of the instance
properties	named list of properties.
namespace_rdf	string. This defines the rdf namespace to use.
biopaxlevel	integer. This sets the version of BioPAX to generate, level 2 and level 3 are supported at the moment.

**Value**

Returns a data.frame with the new properties for the given instance

**Author(s)**

Frank Kramer

---

internal\_resolvePhysicalEntityParticipant

*This function resolves physicalEntityParticipantIDs to their corresponding physicalEntityIDs*

---

**Description**

This function resolves physicalEntityParticipantIDs to their corresponding physicalEntityIDs. Every physicalEntityParticipant corresponds exactly to one physicalEntity.

**Usage**

```
internal_resolvePhysicalEntityParticipant(biopax, physicalEntityId)
```

**Arguments**

biopax	A biopax model
physicalEntityId	string. IDs of physicalEntityParticipants to be resolved

**Value**

Returns ids of physicalEntity corresponding to the specified physicalEntityParticipantIDs

**Author(s)**

fkramer

---

internal\_XMLInstance2DF

*This function is an internal function that parses a Biopax XMLNode.*

---

**Description**

This function is an internal function that parses a Biopax XMLNode. Do not call it manually.

**Usage**

```
internal_XMLInstance2DF(myXMLNode, namespace_rdf, ret, rowcount)
```

**Arguments**

myXMLNode	XMLNode
namespace_rdf	String specifying the namespace to use for rdf:resource and rdf:datatype
ret	data.table object containing the already parsed data to attach this instance to
rowcount	Numeric specifying the row at which further parsed data is inserted into the data.table

**Value**

Returns a list containing the new rowcount and the instance id of the added instance

**Author(s)**

Frank Kramer

---

intersectGraphs	<i>This function returns a graph computed by the insection of supplied graph1 and graph2.</i>
-----------------	---

---

**Description**

This function returns a graph computed by the insection of supplied graph1 and graph2. Layout and weights of graph1 are kept.

**Usage**

```
intersectGraphs(graph1, graph2)
```

**Arguments**

graph1	graphNEL
graph2	graphNEL

**Value**

Returns the intersection of graph1 and graph2.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(intersectGraphs(mygraph1,mygraph2))
```

---

isOfClass	<i>Checks if instances in the biopax data.table are of the given class</i>
-----------	--

---

**Description**

This function checks if instances in the supplied biopax data.table are of a given class. If considerInheritance is set to TRUE it also checks if instances are of a given class or any of its inherited classes.

**Usage**

```
isOfClass(df, class, considerInheritance = FALSE, biopaxlevel = 2)
```

**Arguments**

`df` A data.frame with biopax instances  
`class` A string containing the class name to check for  
`considerInheritance` Logical value indicating whether to consider inheritance or not  
`biopaxlevel` Numeric. Specifies the Biopax Level to use.

**Value**

Returns TRUE for every row in the data.frame which is of the supplied class

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
```

---

<code>isOfNamespace</code>	<i>Check if a classname is preceded by a certain namespace tag like in "namespace:classname"</i>
----------------------------	--

---

**Description**

This function checks if the supplied input string starts with a supplied namespace tag

**Usage**

```
isOfNamespace(classname, namespace = "bp")
```

**Arguments**

`classname` A string containing the classname to check  
`namespace` A string giving the namespace to check for

**Value**

This function returns TRUE if the supplied classname string is preceded with the supplied namespace string, and FALSE if not.

**Author(s)**

Frank Kramer

---

isURL	<i>Check if a string is an URL, preceded by "http:"</i>
-------	---

---

**Description**

This function checks if the supplied input string starts with "http:"

**Usage**

```
isURL(string)
```

**Arguments**

string            A string containing the classname to check

**Value**

This function returns TRUE if the supplied classname string starts with "http:", and FALSE if not.

**Author(s)**

Frank Kramer

---

layoutRegulatoryGraph	<i>This function generates a (more or less) beautiful layout for a regulatory graph.</i>
-----------------------	--

---

**Description**

This function generates a (more or less) beautiful layout for a regulatory graph. Call this after you generated a graph with pathway2RegulatoryGraph. Since beauty is always in the eye of the beholder consider this a starting point for making your graphs even nicer. Rgraphviz with dot layout is used. Edges are green/red with normal/tee arrowheads for activations/inhibitions. If you want to specifically paint subgraphs in different colors use lists of vectors with node names for parameter subgraphs and vector of color names for subgraphs.color for your choice of color. The output can be further tweaked by setting layout options using nodeRenderInfo(mygraph) <- list() ... See the Rgraphviz and Graphviz documentations.

**Usage**

```
layoutRegulatoryGraph(  
  mygraph,  
  label = "",  
  node.fixedsize = FALSE,  
  edge.weights = c("green", "black", "red"),  
  edge.arrowheads = c("normal", "tee"),
```

```

subgraphs = list(),
subgraphs.colors = c("#B3E2CD", "#FDCDAC", "#F4CAE4", "#E6F5C9", "#FFF2AE")
)

```

### Arguments

mygraph	graphNEL
label	Label of the graph
node.fixedsize	logical. If font size is fixed or variable in regards to the nodes.
edge.weights	vector. which colors to use for weighted edges
edge.arrowheads	vector. which arrowheads to use for weighted edges
subgraphs	A list of character vectors with node names defining the sub graphs.
subgraphs.colors	vector. which colors to use for subgraphs

### Value

Returns the supplied graph in a layouted form with several parameters set for regulatory graph plotting.

### Author(s)

Frank Kramer

### Examples

```

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
mygraph = layoutRegulatoryGraph(mygraph)
plotRegulatoryGraph(mygraph)

```

---

listComplexComponents *This function lists all components of a given complex.*

---

### Description

This function returns a (unique) data.frame listing all component IDs, names and classes of the supplied complex.

### Usage

```
listComplexComponents(biopax, id, returnIDonly = FALSE, biopaxlevel = 3)
```

**Arguments**

biopax	A biopax model
id	string. A complex ID
returnIDonly	logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

data.frame

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
```

---

listInstances                    *Lists all instances that conform to the selection criteria.*

---

**Description**

Lists all instances that conform to the selection criteria. In contrast to selectInstances this function returns an easier to read list. This function returns an ordered data.table of class, id and name of the instances. Selection criteria are whether instances belong to a certain class or have the specified id or name. Setting a criteria to NULL ignores this criteria. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class, e.g. if class="control" and includeSubClasses=TRUE the function will select catalyses and modulations too, since they are a subclass of class control.

**Usage**

```
listInstances(
  biopax,
  id = NULL,
  class = NULL,
  name = NULL,
  includeSubClasses = FALSE,
  returnIDonly = FALSE,
  biopaxlevel = 3
)
```

**Arguments**

biopax	A biopax model
id	string. ID of the instances to select
class	string. Class of the instances to select
name	string. Name of the instances to select
includeSubClasses	logical. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class
returnIDOnly	logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns a data.frame containing all instances conforming to the given selection criteria. If returnIDOnly=TRUE, only the selector for the internal data.table otherwise.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
# list all instances of class "protein"
listInstances(biopax, class="protein")
# list all instances of class "pathway"
listInstances(biopax, class="pathway")
# list all interaction including all subclasses of interactions
listInstances(biopax, class="interaction", includeSubClasses=TRUE)
```

---

listInteractionComponents

*This function lists all components of a given interaction.*

---

**Description**

This function returns a (unique) data.frame listing IDs, names and classes of all components of the supplied interaction.

**Usage**

```
listInteractionComponents(  
  biopax,  
  id,  
  splitComplexes = TRUE,  
  returnIDonly = FALSE,  
  biopaxlevel = 3  
)
```

**Arguments**

biopax	A biopax model
id	string. A complex ID
splitComplexes	logical. If TRUE complexes are split up into their components and the added to the listing.
returnIDonly	logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

data.frame

**Author(s)**

Frank Kramer

**Examples**

```
# load data  
data(biopaxexample)  
listInteractionComponents(biopax, id="ex_i_100036_activator_1")
```

---

listPathwayComponents *This function lists all pathway components of a given pathway.*

---

**Description**

This function returns a (unique) data.frame listing all component IDs, names and classes of the supplied pathway.

**Usage**

```
listPathwayComponents(
  biopax,
  id,
  includeSubPathways = TRUE,
  returnIDonly = FALSE,
  biopaxlevel = 3
)
```

**Arguments**

biopax	A biopax model
id	string. A pathway ID
includeSubPathways	logical. If TRUE the returned list will include subpathways and pathwaysteps as well.
returnIDonly	logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

data.frame

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
listPathwayComponents(biopax, id="pid_p_100002_wntpathway")
```

---

listPathways	<i>This function returns a list of all pathway ids.</i>
--------------	---

---

**Description**

This function returns a vector of all pathway ids.

**Usage**

```
listPathways(biopax, biopaxlevel = 3)
```

**Arguments**

biopax            A biopax model  
biopaxlevel      integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns a character vector containing the names of all pathways.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
listPathways(biopax)
```

---

mergePathways            *This function merges two given pathways*

---

**Description**

This function merges two given pathways and appends it to the supplied biopax model. The user has to specify a new name for the pathways and can supply ID, ORGANISM and COMMENT properties for the new pathway. If no ID is supplied, a new unique ID is generated. If no organism property is supplied the organism property of the first pathway is re-used. If ORGANISM is NULL the property is not set. Optionally a comment can be added to the pathway.

**Usage**

```
mergePathways(  
  biopax,  
  pwid1,  
  pwid2,  
  NAME,  
  id = NULL,  
  ORGANISM = "",  
  COMMENT = NULL  
)
```

**Arguments**

biopax            A biopax model  
pwid1            string. ID of first pathway to merge  
pwid2            string. ID of second pathway to merge

NAME	string. Name of the new merged pathway
id	string. ID for the pathway. If NULL a new ID is generated with prefix "pathway".
ORGANISM	string. Organism property of the pathway. By default uses the same organism as the first supplied pathway. If NULL no organism property is set.
COMMENT	string. An optional comment

**Value**

A biopax model with the merged pathway added.

**Author(s)**

fkramer

---

**pathway2AdjacencyMatrix**

*This function generates an adjacency matrix from the activations/inhibitions of a pathway in a biopax model. This function internally first calls pathway2RegulatoryGraph, then converts the regulatory graph to an adjacency matrix. See pathway2RegulatoryGraph for more details.*

---

**Description**

This function generates an adjacency matrix from the activations/inhibitions of a pathway in a biopax model.

This function internally first calls pathway2RegulatoryGraph, then converts the regulatory graph to an adjacency matrix. See pathway2RegulatoryGraph for more details.

**Usage**

```
pathway2AdjacencyMatrix(  
  biopax,  
  pwid,  
  expandSubpathways = TRUE,  
  splitComplexMolecules = TRUE,  
  useIDasNodenames = FALSE,  
  verbose = TRUE  
)
```

## Arguments

biopax	A biopax model
pwid	string
expandSubpathways	logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
splitComplexMolecules	logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges.
useIDasNodenames	logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.
verbose	logical

## Value

Returns the adjacency matrix representing the regulatory graph of the supplied pathway.

## Author(s)

Frank Kramer

## Examples

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
pathway2AdjacencyMatrix(biopax, pwid1)
```

---

pathway2Geneset	<i>This function generates the gene set of a pathway. This function generates a gene set of all physicalEntity's of a pathway. First all interactions of the pathway are retrieved and all components of these interactions are then listed.</i>
-----------------	--

---

## Description

This function generates the gene set of a pathway.

This function generates a gene set of all physicalEntity's of a pathway. First all interactions of the pathway are retrieved and all components of these interactions are then listed.

## Usage

```
pathway2Geneset(biopax, pwid, returnIDonly = FALSE, biopaxlevel = 3)
```

**Arguments**

biopax	A biopax model
pwid	string
returnIDonly	logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns the gene set of the supplied pathway. Returns NULL if the pathway has no components.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pathway2Geneset(biopax, pwid=pwid1)
```

---

pathway2Graph	<i>This function generates a directed graph from all the interactions of a specified pathway in a biopax model. Edges with no direction are indicated by a 0 weight.</i>
---------------	--

---

**Description**

This function generates a directed graph from all the interactions of a specified pathway in a biopax model. Edges with no direction are indicated by a 0 weight.

**Usage**

```
pathway2Graph(  
  biopax,  
  pwid,  
  expandSubpathways = TRUE,  
  splitComplexMolecules = FALSE,  
  useIDasNodenames = TRUE,  
  verbose = FALSE,  
  withDisconnectedParts = TRUE  
)
```

**Arguments**

biopax	A biopax model
pwid	string
expandSubpathways	logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
splitComplexMolecules	logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges. Default value is FALSE
useIDasNodenames	logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.
verbose	logical
withDisconnectedParts	logical. If TRUE the pathway graph is returned as such, else only the largest connected component is given back

**Value**

Returns the a graph object of the specified pathway. Edges with no direction are indicated by a 0 weight.

**Author(s)**

Nirupama Benis

**Examples**

```
# load data
data(biopaxLevel3Example) # location of the data
pwid <- "Pathway1019"
# build pathway using pathway2Graph
pathwayAsGraph <- pathway2Graph(biopax = biopaxLevel3Example, pwid = pwid, splitComplexMolecules = FALSE, useIDasN
pathwayAsGraph # should have 23 nodes, 24 edges
plotRegulatoryGraph(pathwayAsGraph)
# build pathway discarding the disconnected parts of the graph
pathwayAsGraph <- pathway2Graph(biopax = biopaxLevel3Example, pwid = pwid, splitComplexMolecules = FALSE, useIDasN
pathwayAsGraph # should have 10 nodes, 11 edges
plotRegulatoryGraph(pathwayAsGraph)
```

---

 pathway2RegulatoryGraph

*This function generates the regulatory graph from the activations/inhibitions of a pathway in a biopax model. This function builds a graph from the pathway components of the supplied pathway. Only instances of class 'control' are considered, this leads a functional graph with all edges either representing activations or inhibitions. No transports, no translocation, etc. If desired complexes can be split up into several nodes, this can sometimes lead to a more complex and cluttered graph. There can not be multiple edges between 2 nodes. Whenever duplicated edges are generated (especially by splitting up complexes) a warning is thrown.*

---

**Description**

This function generates the regulatory graph from the activations/inhibitions of a pathway in a biopax model.

This function builds a graph from the pathway components of the supplied pathway. Only instances of class 'control' are considered, this leads a functional graph with all edges either representing activations or inhibitions. No transports, no translocation, etc. If desired complexes can be split up into several nodes, this can sometimes lead to a more complex and cluttered graph. There can not be multiple edges between 2 nodes. Whenever duplicated edges are generated (especially by splitting up complexes) a warning is thrown.

**Usage**

```
pathway2RegulatoryGraph(
  biopax,
  pwid,
  expandSubpathways = TRUE,
  splitComplexMolecules = TRUE,
  useIDasNodenames = FALSE,
  verbose = TRUE
)
```

**Arguments**

biopax	A biopax model
pwid	string
expandSubpathways	logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
splitComplexMolecules	logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges.

useIDAsNodenames      logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.

verbose                logical

**Value**

Returns the representing the regulatory graph of the supplied pathway in a node-edge-list graph.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
plotRegulatoryGraph(mygraph)
```

---

plotRegulatoryGraph      *This function layouts a regulatory graph and plots it using Rgraphviz.*

---

**Description**

This function takes a regulatory graph as generated by pathway2regulatoryGraph and plots it using standard layout options of layoutRegulatoryGraph. This function is a wrapper for layoutRegulatoryGraph with standard parameters. Subgraphs can be painted with different colors. This can be done by passing parameter subgraph a list of character vectors with node names.

**Usage**

```
plotRegulatoryGraph(mygraph, subgraphs = list(), layoutGraph = TRUE)
```

**Arguments**

mygraph                graphNEL, regulatory graph

subgraphs              list of character vectors with node names

layoutGraph            logical. If FALSE the graph is not laid out again but send directly to Rgraphviz::renderGraph.

**Value**

none

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
plotRegulatoryGraph(mygraph)
```

---

print.biopax	<i>Print a biopax object.</i>
--------------	-------------------------------

---

**Description**

Print a biopax object.

**Usage**

```
## S3 method for class 'biopax'
print(x, ...)
```

**Arguments**

x	A biopax object to print.
...	Other arguments to be passed to print.

**Examples**

```
data(biopaxexample)
print(biopax)
```

---

readBiopax	<i>This function reads in a Biopax .owl file</i>
------------	--

---

## Description

This function reads in a Biopax .owl file and generates the internal data.frame format used in this package. This function can take a while with really big Biopax files like NCIs Pathway Interaction Database or Reactome. In almost every case this is your starting point. Returns a biopax model, which is a list with named elements:

**df** The data.frame representing the biopax in R  
**ns\_rdf** RDF Namespace  
**ns\_owl** OWL Namespace  
**ns\_bp** Biopax Namespace  
**file** File name

## Usage

```
readBiopax(file, verbose = TRUE)
```

## Arguments

**file** string. File name  
**verbose** logical. Output messages about how parsing is going and so on.

## Value

A biopax model

## Author(s)

Frank Kramer

## Examples

```
## Not run: biopax = readBiopax(file="biopaxmodel.owl")  
## Not run: biopax  
#' # load data and retrieve wnt pathway  
data(biopaxexample)
```

---

removeDisconnectedParts

*This function is used internally by pathway2Graph to remove the smaller disconnected parts of the pathway graph.*

---

## Description

This function is used internally by pathway2Graph to remove the smaller disconnected parts of the pathway graph.

**Usage**

```
removeDisconnectedParts(mygraph)
```

**Arguments**

mygraph            a graph object

**Author(s)**

Nirupama Benis

---

removeInstance            *This function removes an instance*

---

**Description**

This function removes an instance from an existing biopax model.

**Usage**

```
removeInstance(biopax, id)
```

**Arguments**

biopax            A biopax model  
id                string. ID of the instance

**Value**

Returns the supplied biopax model with the instance removed from it.

**Author(s)**

Frank Kramer

**Examples**

```
# load data  
data(biopaxexample)  
biopax2 = removeInstance(biopax, 1)
```

---

`removeNodes`*This function gracefully removes nodes from a regulatory graph.*

---

### Description

This function gracefully removes nodes from a regulatory graph. If the node to be removed has both parent and child nodes, these are connected directly. The weight of the new direct edge is the product of multiplying the incoming and outgoing edge weights of the original node.

### Usage

```
removeNodes(graph, nodes)
```

### Arguments

<code>graph</code>	<code>graphNEL</code>
<code>nodes</code>	vector of node names specifying which nodes to remove.

### Value

Returns a graph with specified nodes removed.

### Author(s)

Frank Kramer

### Examples

```
# load data and retrieve wnt pathway
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph1 = layoutRegulatoryGraph(mygraph1)
# retrieve all nodes
nodes = nodes(mygraph1)
# random expression data for your nodes
values = rnorm(length(nodes), mean=6, sd=2)
# color nodes of the graph
mygraph1 = colorGraphNodes(mygraph1, nodes, values, colors="greenred")
# plot the now colored graph
plotRegulatoryGraph(mygraph1, layoutGraph=FALSE)
```

---

removeProperties	<i>This function removes a property</i>
------------------	---

---

**Description**

This function removes a property from an existing biopax instance.

**Usage**

```
removeProperties(biopax, id, properties)
```

**Arguments**

biopax	A biopax model
id	string. ID of the instance
properties	character vector. listing the properties to remove.

**Value**

Returns the supplied biopax model with properties removed from this instance.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
biopax2 = removeProperties(biopax, 1, "name")
```

---

selectInstances	<i>Returns all instances that conform to the selection criteria.</i>
-----------------	--

---

**Description**

Returns all instances that conform to the selection criteria. This function returns a subset of the internal `data.table` of the biopax object. Selection criteria are whether instances belong to a certain class or have the specified id, property or name. Setting a criteria to NULL ignores this criteria. If `returnValues` is set to FALSE only the selector (a logical vector with length of the internal `data.table`) is returned, otherwise the selected data is returned. If `includeSubClasses` is set to TRUE the class criteria is broadened to include all classes that inherit from the given class, e.g. if `class="control"` and `includeSubClasses=TRUE` the function will select catalyses and modulations too, since they are a subclass of class control. If `includeReferencedInstances` is set to TRUE all instances that are being referenced by the selected instances are being selected too. The parameter works recursively, this means for example that a selected pathway and all its interactions, complexes, molecules and annotations are returned if this parameter is set to true. This parameter is especially helpful if you want to migrate or merge knowledge from different data bases.

**Usage**

```

selectInstances(
  biopax,
  id = NULL,
  class = NULL,
  property = NULL,
  name = NULL,
  returnValues = TRUE,
  includeSubClasses = FALSE,
  includeReferencedInstances = FALSE,
  returnCopy = TRUE,
  biopaxlevel = 3
)

```

**Arguments**

biopax	A biopax model or a compatible internal data.table
id	string. ID of the instances to select
class	string. Class of the instances to select
property	string. Return only this property of the instances
name	string. Name of the instances to select
returnValues	logical. If returnValues is set to FALSE only the selector (a logical vector with length of the internal data.table) is returned, otherwise the selected data is returned
includeSubClasses	logical. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class
includeReferencedInstances	logical. If includeReferencedInstances is set to TRUE all instances that are being referenced by the selected instances are being selected too
returnCopy	logical. Defaults to TRUE. If TRUE a copy of the internal data.table is returned. If FALSE data is returned by reference. Set to FALSE to increase speed when only ever reading data. Make sure you understand the implications of using this! See vignette of data.table package.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns a data.table containing all instances conforming to the given selection criteria if returnValues=TRUE, only the selector for the internal data.table otherwise.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
# select the subset of the internal data.table that belongs to class "protein"
selectInstances(biopax, class="protein")
# select the subset of the internal data.table that belongs to class "interaction"
selectInstances(biopax, class="interaction")
# select the subset of the internal data.table that belongs to class "interaction" or any of its sub classes, like c
selectInstances(biopax, class="interaction", includeSubClasses=TRUE)
# select the subset of the internal data.table that belongs to class "pathway" AND is a "NAME" property
selectInstances(biopax, class="pathway", property="NAME")
```

---

splitComplex

*This functions splits up a complex into its components.*

---

**Description**

This function looks up the supplied Complex ID and returns the names of all its components.

**Usage**

```
splitComplex(
  biopax,
  complexid,
  recursive = TRUE,
  returnIDonly = FALSE,
  biopaxlevel = 3
)
```

**Arguments**

biopax	A biopax model
complexid	string ID of an complex
recursive	logical
returnIDonly	logical. If TRUE only IDs of the components are returned. This saves tiem for looking up names for every single ID.
biopaxlevel	integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns a character vector with the names of all subcomponents.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
selectInstances(biopax, id="ex_m_100650")
listInstances(biopax, id="ex_m_100650")
listComplexComponents(biopax, id="ex_m_100650")
splitComplex(biopax, complexid="ex_m_100650")
```

---

striphash	<i>Strips a hash in front of a string</i>
-----------	---

---

**Description**

Strips a hash in front of a string

**Usage**

```
striphash(x)
```

**Arguments**

x                    A string to be stripped off a preceeding hash

**Value**

The supplied string with a hash "#" stripped off front.

**Author(s)**

Frank Kramer

---

stripns	<i>Strips a namespace tag off a supplied classname string</i>
---------	---

---

**Description**

Strips a namespace tag off a supplied classname string

**Usage**

```
stripns(classname)
```

**Arguments**

classname            A string containing a classname preceded by a namespace tag

**Value**

The classname with the namespace tag stripped off it.

**Author(s)**

Frank Kramer

---

transitiveClosure      *This function generates the transitive closure of the supplied graph.*

---

**Description**

This function generates the transitive closure of the supplied graph. In short: if A->B->C then an edge A->C is added. Edge weights are conserved if possible (in a hopefully smart way). This is a simple convenience wrapper for the RBGL function `transitive.closure`.

**Usage**

```
transitiveClosure(mygraph)
```

**Arguments**

mygraph      graphNEL

**Value**

Returns the transitive closure of the supplied graph.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
tc = transitiveClosure(mygraph)
```

---

transitiveReduction     *This function generates the transitive reduction of the supplied graph.*

---

**Description**

This function is deprecated due to nem dropping out of Bioconductor in BioC 4.0. This function generates the transitive reduction of the supplied graph. In short: if A->B->C AND A->C then edge A->C is removed. This is a simple convenience wrapper for the NEM function transitive.reduction. Be aware of implications on the edge weights!

**Usage**

```
transitiveReduction(mygraph)
```

**Arguments**

mygraph            graphNEL

**Value**

Returns the transitive reduction of the supplied graph.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
tr = transitiveReduction(mygraph)
```

---

unfactorize            *Replace factors/levels in a data.frame and use plain strings instead*

---

**Description**

This function takes a data.frame as argument and returns it with strings instead of factors.

**Usage**

```
unfactorize(df)
```

**Arguments**

df                    any data.frame with factor levels in at least one column

**Value**

The data.frame is returned using strings instead of factors.

**Author(s)**

Frank Kramer

---

uniteGraphs                    *This function unites two graphs.*

---

**Description**

This function unites the two supplied graphs. Layout parameters from graph1 are used. If colorNodes==TRUE the returned graph has different colors for overlapping nodes and nodes individual for each graph.

**Usage**

```
uniteGraphs(  
  graph1,  
  graph2,  
  colorNodes = TRUE,  
  colors = c("#B3E2CD", "#FDCCAC", "#F4CAE4")  
)
```

**Arguments**

graph1                    graphNEL  
graph2                    graphNEL  
colorNodes                logical  
colors                    colors character vector of colors. If colorNodes==TRUE these colors are used for graph1 and graph2 respectively.

**Value**

Return a graph generated by uniting the two supplied graphs

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(uniteGraphs(mygraph1, mygraph2))
```

---

writeBiopax

*This function writes out a biopax model.*

---

**Description**

This function writes out a biopax model, as generated by readBiopax, to either a file or returns the xmlTree if file is omitted.

**Usage**

```
writeBiopax(
  biopax,
  file = "",
  verbose = TRUE,
  overwrite = FALSE,
  namespaces = list(rdf = "http://www.w3.org/1999/02/22-rdf-syntax-ns#", bp =
    "http://www.biopax.org/release/biopax-level2.owl#", rdfs =
    "http://www.w3.org/2000/01/rdf-schema#", owl = "http://www.w3.org/2002/07/owl#", xsd
    = "http://www.w3.org/2001/XMLSchema#")
)
```

**Arguments**

biopax	A biopax model as generated by readBiopax
file	A string giving a file name.
verbose	logical
overwrite	logical, if TRUE an already existing file will be overwritten, otherwise an error is thrown
namespaces	A list of namespaces to use for the generated XML/RDF file

**Value**

Returns the xmlTree object generated from the biopax model. If a filename is supplied the XML is written to this file.

**Author(s)**

Frank Kramer

**Examples**

```
# load data
data(biopax2example)
## Not run: writeBiopax(biopax, file="mybiopax.owl")
```
